## *What is proRM Bulk Booking?*

### *proRM Bulk Booking Overview*

The possibility to reduce expenses can become an important competitive advantage of a company. One of the ways to help achieve this goal is saving time. However, all the administrative functions of Project Managers usually take up a great part of the working time of a manager. Thus, it becomes useful to exploit these kinds of applications, which significantly help to economize time expenditures. One of the best examples of these applications is proRM Bulk Booking.

proRM Bulk Booking gives you a chance to rebook entries to another project. It means that it is possible to pick out necessary bookings and allocate them to other projects or subprojects – having to move them not one by one, but all selected entries at once. This lets Project Managers easily correct their mistakes without having to spend time on the creating of new entries.

There is also one more important feature – all the expenses and documents such as receipts, tickets, etc. will be rebooked within the application to the projects or subprojects together with the entries for which they were created.

# The Advantages of proRM Bulk Booking

## General Concept

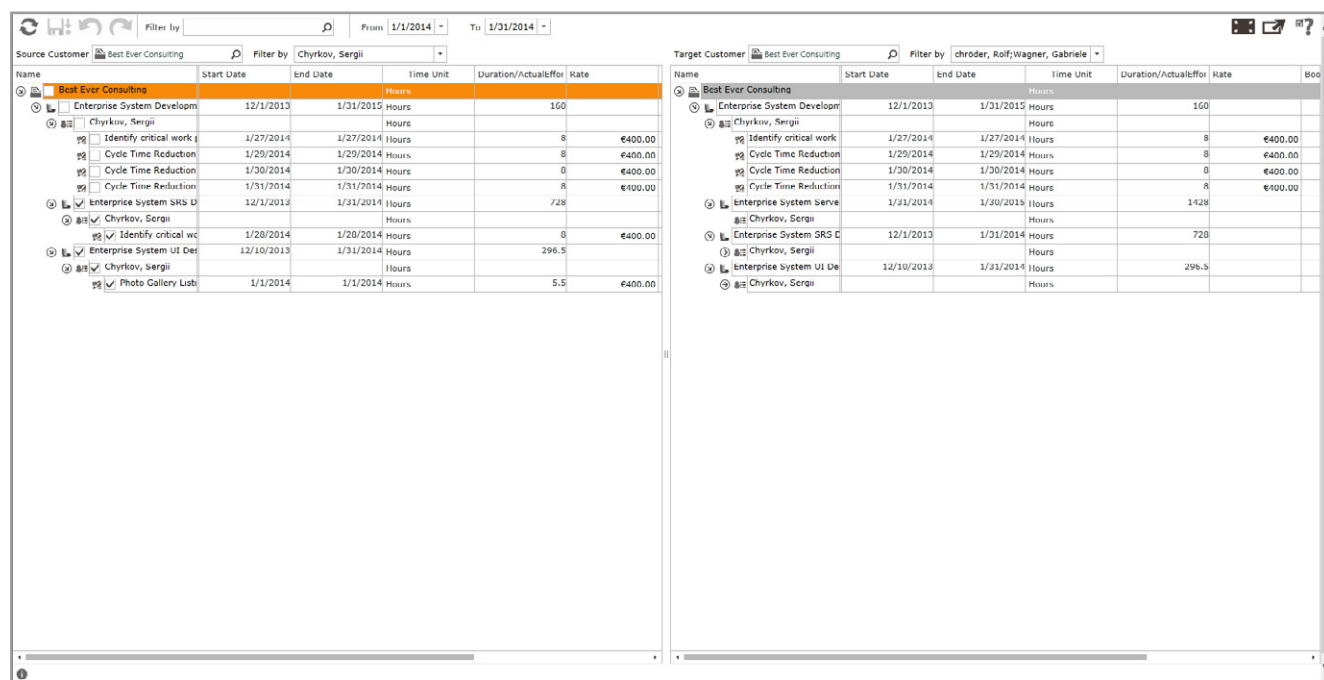

proRM Bulk Booking was specially developed to give a Project Manager a way to speed up managerial processes and be able to do a mass rebooking in seconds.

## Using proRM Bulk Booking

proRM Bulk Booking gives you the potential to rebook in a fast and easy way. The application consists of two parts: the first one is a "Source Customer," who has necessary bookings for switching; another one is "Target Customer," who receives the bookings. Both parts have project tree views and thus an understandable structure. They include such necessary information such as the dates of projects, chosen for the project Time Unit, actual efforts, booking types and estimated efforts.

It takes seconds to choose the source and the target customers and realize the efficiencies of the rebooking. If there is a need to rebook more than one booking, it is possible to exercise the simple drag & drop function between the two parts of the application.

**proRM Bulk Booking: It gives an easy and quick way to exercise bulk bookings.**
